Figure 1
Real growth in GDP

www.statbank.dk/nan1

Progress in economic development

GDP increased by 1.2 per cent in 2015. The real growth in GDP averaged 2.4 per cent annually from 2003 to 2007, while the growth rate in 2008 and 2009 was -2.9 per cent annually on average. Since the economic crisis in 2009, the average growth rate was 0.8 per cent in the period 2010-2015.

Increase in employment

In 2015 employment increased by 30,600 persons. After 4 years of decrease in employment from 2008 to 2012 and stagnation in 2013, employment increased by 22,300 persons in 2014. Thus, employment has increased by 56,100 persons since 2012. In 2015, the average number of persons employed was approximately 2,795,700.

Often, changes in employment are lagged compared to the economic growth. This was seen clearly in 2008 when the economic conditions changed.

Figure 2 **Annual growth in employment**

Note: Including persons on leave.

www.statbank.dk/nan1

The share of the workforce employed in goods-producing industries (agriculture, manufacturing, energy, and construction) has been continuously declining for several years. In 2005, 23.2 per cent was employed in the goods-producing industries, while in 2015 the proportion was 19.9 per cent. During the same period, employment increased, in particular in the private service industries (from 46.0 per cent in 2005 to 49.6 per cent in 2015). The percentage of persons employed in public and personal services was 29.8 per cent in 2005 and 29.2 per cent in 2015.

Increased demand from exports

Total demand increased by 0.3 per cent in 2015. Domestic demand contributed with 0.7 per cent of this development whereas export demand contributed with -0.4 per cent. The increased demand was covered by an increase in domestic creation of value while the supply was affected negatively by foreign trade. Thus, a GDP increase of 0.8 per cent and decreased imports of -0.5 per cent contributed to the total supply.

Total demand and total supply are by definition equal and change by the same rate. An increase in total demand is caused by an increase in exports or domestic demand. An increase in total supply originates from an increase in imports or domestic value added measured by GDP.

Periods with strong growth in demand often cause a similar growth in imports because, in the short run, GDP cannot expand sufficiently to meet the demand. This tendency can be seen in the period 2004-2006, where the contributions from imports to the growth in supply were large and increasing.

In 2008, where the decline in GDP began, there was a marginal increase in total demand, which consisted of an increase in exports and a decline in domestic demand. On the supply side the picture was the same – imports increased and GDP decreased. Large decreases in demand from both exports and domestic markets in 2009 contributed to a strong decline in total demand. This led to substantial decreases in supply from both imports and GDP.

The growth in both total demand and total supply is primarily powered by increased foreign trade in the years following the financial crisis up to 2014. The development in 2015 seems to break with the pattern.

Figure 3 Contribution to real annual growth in GDP

Stagnant foreign trade

There was a decrease in foreign trade in 2015. The import of goods and services decreased by 1.4 per cent and export decreased by 1.0 per cent. After a considerable decline in 2009, the foreign trade recovered in the following years until 2014. Foreign trade increased especially in 2011, but solid growth rates can also be seen in 2014.

Viewed over a large number of years, external trade has increased considerably and, today, makes up a far greater share of valued added than was previously the case. As shares of GDP, imports and exports increased from making up 38 and 45 per cent respectively in 2000 to more 47 and 53 per cent in 2015. The development was particularly strong during the economic boom from 2004 to 2007. The import and export shares of GDP peaked in 2008 with 50 and 54 per cent respectively, since then there have been a minor decrease.

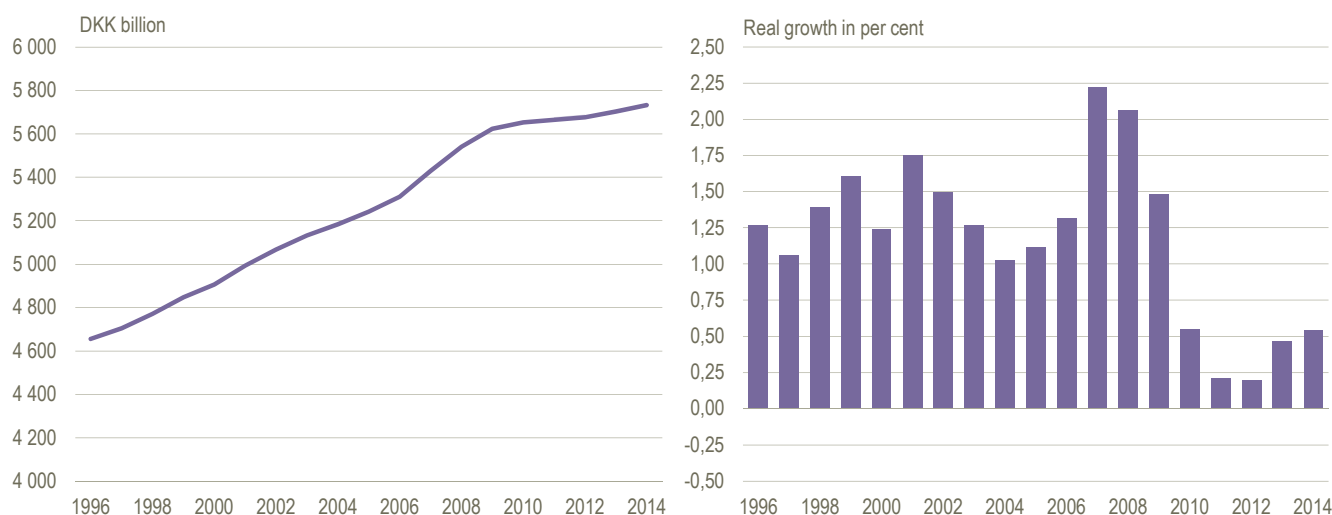

Particularly, trade in services has increased steeply. The trade in services have increased from 32 per cent of the foreign trade in 2000 to constitute 38 per cent in 2015. Despite this, trade in goods still constitutes the main part of total foreign trade.

Figure 4 Imports and exports as percentage of GDP, current prices

www.statbank.dk/nan1

The capital stock largely unchanged in 2014

The capital stock (net stock of fixed capital) grew by 0.5 per cent in 2014. In general, there has been a slow development in capital stock since 2010. In the previous 15-year period from 1995 to 2010 the capital stock increased by 23.0 per cent, which corresponds to an average annual growth of 1.3 per cent. Since 2010 there has been an average annual growth of 0.4 per cent. The change in capital stock between two dates reflect the net investments, i.e. gross fixed capital formation less consumption of fixed capital.

Figure 5 Net capital stock.

www.statbank.dk/nahk

Slight increase in productivity

Productivity increased by 0.3 per cent in 2014 and is largely at the same high level as it was in 2010. Based on the figures from the Danish working time account, it is possible to calculate productivity per hour as the market gross domestic product at factor cost per working hour. The average annual growth in productivity was 1.7 per cent in the period 1994-2007. Since then productivity has increased with an average of 0.5 per cent annually. It has been a period characterised by high volatility. For instance, in 2010 productivity increased by 6.2 per cent while it - on average - has

remained unchanged for the last four years. The high volatility is among other things caused by the previously mentioned delayed adjustment of the labour consumption for the economic activity associated with the financial crisis.

Figure 6 Gross domestic product at factor cost per hour. Annual growth rate

www.statbank.dk/np23

Increasing wage share

Total income from production comprises compensation of employees and enterprises' profits (gross operating surplus and mixed income). The share of wages and salaries of total income decreased significantly in 2010 and decreased further in 2011, 2012. Since 2012 wage shares have continued to increase and are now at 61.8 per cent.

From 1994 to 2006 the wage share increased slightly. From 2006 to 2009 the wage share increased significantly and reached a peak level of 64.1 per cent in 2009 before decreasing up to 2012.

Figure 7 The wage share

www.statbank.dk/nahd22

Unchanged savings ratio

The savings ratio of the Danish economy is calculated as savings as a percentage of the gross national disposable income. The savings ratio increased steadily from 23.1 per cent in 1995 to over 27 per cent in 2006-2007 and again in 2014. In 2009 the savings ratio decreased to 22.4 per cent and has been growing steadily up to 2014 then decreased to 26.4 per cent in 2015.

Since 1999, Denmark's balance of payments has shown a surplus on the current account. Including capital transfers, there has also been positive net lending. There was a significant increase in net lending in 2010 and it is estimated at DKK 139.3 billion for 2015.

Figure 8 Savings ratio, current prices

Financial claims

Rise in financial net equity of households

2014 was another year of growth in the financial net equity of households. The net worth has increased every year since the fall in the net equity in 2008 as a result of the financial crisis.

The explanation can be found in the evolution of *other changes in status, net* where the development in the financial markets in 2009 to 2014 gave positive revaluations. In 2007 and 2008 net equity was affected by large negative revaluations.

Especially price fluctuations have affected the households' net equity both directly and indirectly through their pension scheme savings in life insurance companies and pensions funds.

In addition to the household sector, the national accounts include financial accounts for five other main sectors: non-financial corporate sector, financial corporate sector, general government sector, non-profit institutions serving households (NPISH) and the rest of the world. The financial claims consist of a number of financial assets and liabilities comprising, e.g., shares, bonds and loans. The difference between the total financial assets and the total financial liabilities constitute the financial net worth.

Figure 9 Development in the net equity of households

www.statbank.dk/nasf

Inflation

Low inflation in 2015

In 2015 the inflation (measured as the annual increase in the GDP deflator) in Denmark was 1.0 per cent. In recent years the inflation has fluctuated with high inflation rates in 2008, 2010 and 2012 and inflation rates below 1 per cent in 2009, 2011 and 2014. Between 1990 and 2007 the inflation was both low and stable. The average increase in annual prices in the period was 2.1 per cent, and only in 2000 and 2005 did the inflation reach 3 per cent. The average inflation rate since 2010 is 1.3 per cent.

Figure 10 Inflation measured as annual change in the GDP deflator

www.statbank.dk/nahl2

International comparison of GDP

International economic growth

In 2009 the economic decline became global with a massive economic decline in most countries. Denmark was also affected by an unusually severe downturn.

In 2010, the economic development turned with increases in GDP as a result. That same year Sweden reached a pre-crisis level, while it took a year before Germany's GDP reached a pre-crisis level. The United States returned to a pre-crisis level in 2011, while it was not until 2014 that the EU as a whole reached the level. Denmark's GDP is still below the pre-crisis level.

In 2015 the EU as a whole had an increase in GDP of 1.9 per cent, while the Danish GDP only increased by 1.2 per cent. Sweden had strong economic growth with a growth rate of more than 4 per cent. The GDP growth in Great Britain and the United States was also strong with growth rates over 2 per cent. If one considers the development in the GDP per capita, the growth gap between the EU and the United States is smaller due to higher population growth in the United States.

Figure 11

GDP in selected countries, constant prices

Public sector

Composition of the public sector

The public sector comprises the general government sector and public enterprises and public quasi corporations.

The general government sector produces non-market services that are primarily funded through taxes. These services are wholly or partially available to private households and enterprises (e.g. day-care institutions, education and hospitals).

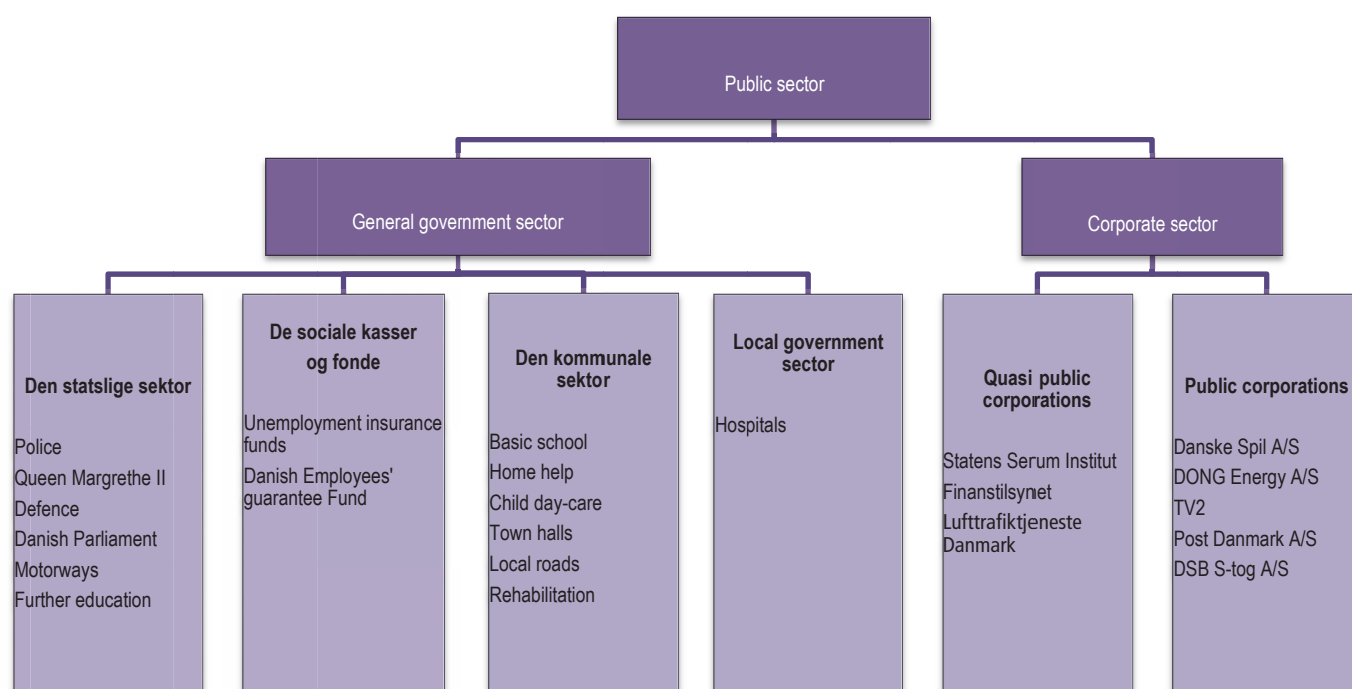

The corporate sector (public enterprises and public quasi corporations) is composed of institutions that are run commercially. Public quasi corporations are part of the public system of accounting, whose accounts are integrated into state or regional accounts (e.g. municipal utility enterprises), while public corporations are organised as a company or similarly according to civil law and are owned or controlled by public authorities (e.g. DONG Energy A/S and the Danish National Railways). This im-

plies that the quasi corporations are 100 per cent controlled by the general government sector, while the public enterprises are controlled to a lesser extent.

In the following, a number of designations are used in describing the public area. It will be explicitly stated if the description also comprises the public corporate sector. Otherwise, figures only relate to the general government sector.

Figure 12

General government sector by areas

The size of the public sector has remained constant since 1993

Since 1993, compared with the total Danish economy, the size of the public sector has remained constant between 26 and 30 per cent of gross domestic product at factor cost, GDP.

Figure 13 GDP at factor cost for the public sector as a percentage of GDP at total factor cost for the total Danish economy

www.statbank.dk/nan1 and off14

Compensation of employees in the public sector accounts for about one third of total wages and salaries paid to employees in the Danish economy, while investments have ranged around 13-19 per cent of total investments in the Danish economy between 1999 and 2010. The investments in the public sector have since increased and accounts for 21 per cent in 2014.

Institutions under the general government sector accounts for about 90 per cent of expenditure on wages and salaries, while they since 2006 has accounted for about 2/3 of investments. Previously, investments have been more evenly distributed between market units and the general government sector.

In recent years a number of privatisations within the public corporate sector have been implemented. This has reduced the size of the public sector. TDC A/S is an example of a company that has shifted status from public corporation to private enterprise, and consequently the company is no longer part of the public sector. Beyond this DR has moved from being classified as a public corporation to being a part of the general government sector due to the license fee is being regarded as a tax in national accounts.

One sixth of the public sector's GDP were created by private corporations

17 per cent of the public sector's GDP at factor costs were created by public corporations in 2014, but only 8 per cent of total wage and salary costs were paid by the public corporations. At the same time, the public corporations account for 29 per cent of total gross capital formation of the public sector.

Figure 14

The public sector divided into general gov. sector and public enterprises. 2014

www.statbank.dk/off14

Figure 15

Public sector surplus (net lending) as a percentage of GDP

www.statbank.dk/off3

Deficit in the public finances in 2015

In 2015 there was a deficit on public finances, as was also the case in 2009-2013. However in 2014 the deficit became a surplus for the first time since 2008. In the 10 years previous years between 1999 and 2008, there had been a surplus on public finances, except for a small deficit in 2003.

Changes in the economic business cycle have a significant influence on public finances. Periods of economic recovery reduce the costs of unemployment benefits and simultaneously increase revenue from taxes and duties. The opposite applies in periods of recession.

Figure 16

Figure 17
public
expenditure as a per-
centage of GDP

Figure 18
Employment in the
general government
sector as a percentage
of total employment

Public net worth turned to net debt in 2011

A surplus or a deficit on public finances impacts the public debt. The size of net debt is significant to the future economic development by having an impact on the fiscal-policy scope in the future. In 2011 the public net worth was turned to a net debt of 1.1 per cent of GDP. In 2015 the public net debt was 5.5 per cent of GDP.

In the years between 1995, when the statistics of public net debt was introduced, and 2006, the general government sector had, despite an increase in 1998, a decreasing net debt. Public net turned into a net wealth in 2007 and further increased until 2008 where it peaked at 6.7 per cent of GDP. Public net worth has then been declining, leading to public net worth again was turned to net debt in 2011.

General government sector

Public expenditure declined since 2012

The size of the general government sector is decided politically and depends on economic and social structure conditions.

The expansion of, e.g. education, social conditions and hospitals in the 1970's gave rise to a sharp growth of the public sector. Furthermore, women's participation in the labour market resulted in an increasing demand for child care.

The proportion of public expenditure of GDP peaked in 1993, with 59.3 per cent. Between 1993 and 2008, there has been a tendency towards a fall in the proportion of public expenditure of GDP. In 2009 the proportion of public expenditure of GDP increased and peaked at 58.3 per cent of GDP in 2012. The level declined from 2013 to 2015. In 2015 the proportion of public expenditure was 55.7 per cent of GDP.

Stagnation in the number employed by the public sector since 1993

The most important factor of production in connection with public production is labour (e.g. teachers, doctors and employees in public administration). About 2/3 of general government consumption comprise wages and salaries. In 1970, the number employed by the general government sector amounted to 14.9 per cent of the total number employed. In 1993, this proportion had increased to about 30.2 per cent, but has since then, apart from a fall in 2007-2008, remained largely constant.

Expenditure by type of transaction

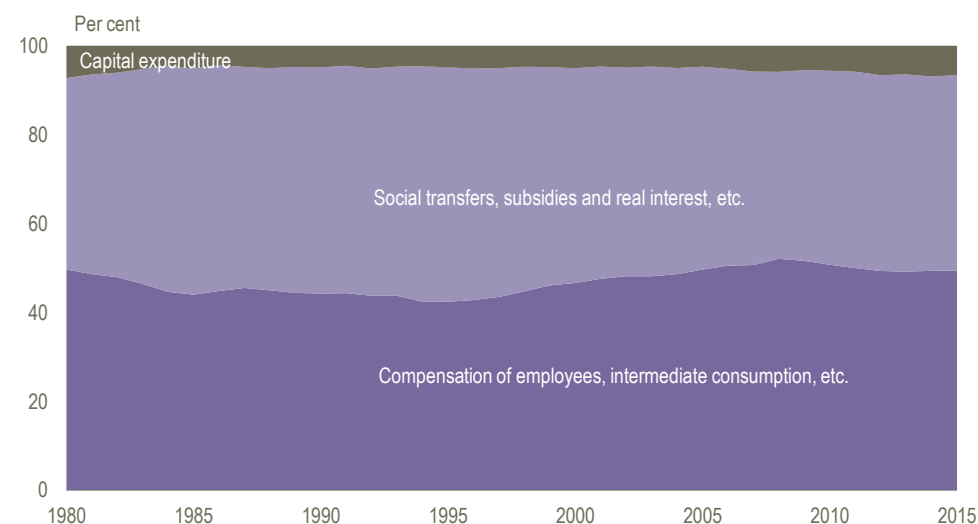

Expenditure by type of transaction shows general government expenditure divided by activities. The distribution of expenditure by type of transaction distinguishes between consumption, current transfers and capital expenditure. Consequently, expenditure by type of transaction shows whether expenditure covers intermediate consumption, redistribution, or capital formation. General government consumption mainly comprises salaries and purchases of goods used in the production of services, which are made available to the public.

Current transfers are primarily transfers to households, including pensions and unemployment benefits. Capital expenditure covers, e.g. investments in schools, hospitals, and roads.

From 1975 until the mid-1990s, public expenditure accounted for a falling share of total public expenditure, while current transfers accounted for an increasing share. From the mid-1990s until 2009, there was a slight increase in the share of public consumption expenditure, while current transfers accounted for a minor fall. Since 2008, the share of consumption has slightly decreased which was offset by an increase in the current transfers and capital expenditure. The percentage of capi-

tal expenditure has fallen until the mid-1980s, but has since then showed a relatively constant share of public expenditure until 2005. There has since then been a tendency to increase in the past years and the highest level since 1980 occurred in 2014 at 6.9 per cent.

Figure 19 Public expenditure¹ by type of transaction

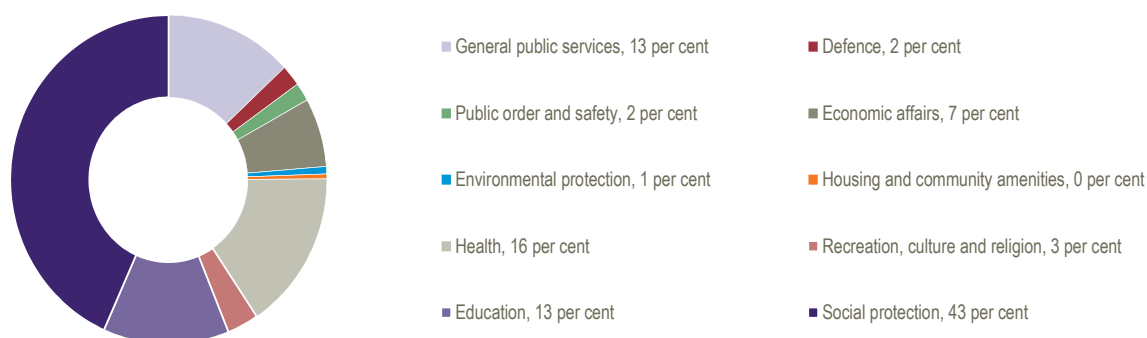

¹ General government current and capital expenditure, including consumption of fixed capital plus sales of goods and services.

www.statbank.dk/off3

Public expenditure by function

The distribution of expenditure by function distinguishes public expenditure by function. Public expenditure by function provides an overview of the mutual size distribution of expenditure among the individual categories, e.g. health, defence, education, etc. The distribution of expenditure by function has been more or less stable since 1985. However, there has been a slight increase in expenditure on social conditions, which has been compensated for by a reduction in the proportion of expenditure on overall general government services and economic services.

Figure 20 current and capital expenditure by function. 2015

www.statbank.dk/off29

Expenditure on overall public services along with defence, public order and safety, are categories for which expenditure has historically been the basis for the general government sector. Expenditure on general public services amounts to 13.1 per cent of total public expenditure and comprises general government administration, etc.

Defence, public order and safety each accounted for 2 per cent of the resources. Education, health and social security are functions which are considered core services in a modern welfare state. 71.8 per cent of expenditure in 2015 was spent on these functions.

Expenditure on social security accounts for the largest amount of resources (43.3 per cent). This includes expenditure on, e.g. old-age pension, unemployment benefits, and cash benefits. Expenditure on education and health amounts to 12.8 per cent and 15.7 per cent of total expenditure, respectively. 6.7 per cent of expenditure was spent on economic services, which include especially expenditure on economic, trade, labour market plus transport, communication, and other business services. 0.5 per cent and 3.2 per cent, respectively, are spent on housing and public facilities and on religion, leisure and culture.

Taxes and duties

Taxes as per cent of GDP relatively stable since 1988

General government expenditure is reflected in a similar need for funding where taxes and duties in particular play a decisive role.

In the years from 1975 to 1988, the share of taxes and duties of GDP increased from 37.1 per cent to 47.2 per cent. Since 1988, this proportion has remained almost constant and was 47.0 per cent in 2015.

No changes in the tax structure for 40 years

Total taxes can be divided into four main types: Income and property taxes, production and import taxes, capital taxes and compulsory contributions to social security schemes.

Income and property taxes account for the largest share of total taxes. Income and property taxes are taxes on incomes earned by individuals and enterprises (e.g. personal taxes, corporation tax, real interest tax), and taxes linked to the possession of property (e.g. vehicle excise duty).

Figure 21
Taxes and duties as a percentage of GDP

www.statbank.dk/nat01 and off12

Figure 22 National accounts distribution of total taxes and duties

www.statbank.dk/off3

Production and import taxes are other large items, which primarily comprise VAT and various selective excise duties. Some production and import taxes are used to influence the behaviour of people and companies (e.g. “green” taxes and duties).

The last two items, capital taxes and compulsory contributions to social schemes, are not significant in terms of revenue. The latter is important in other countries where many welfare benefits are funded by compulsory contributions and where social benefits are granted with reference to people's attachment to the labour market.

The distribution of total taxes and duties has been stable since mid-1980's.

Distribution of tasks and burden

Division of responsibilities between the sub-sectors

Since 2007 the general government sector can be divided into the following sub-sectors: municipalities and regions, the state and social security funds. In Denmark, there is a high degree of division of responsibilities between the individual sub-sectors. This division of responsibilities can be described by distributing expenditure according to tasks and burden. The distribution of tasks shows expenditure according to the sector that is responsible for such tasks in relation to the public. The sector funding the expenditure is shown by the distribution of burden.

The state covers more of the expenditure than the division of responsibilities dictates. Regions (from 2007), social security funds, and especially municipalities cover less expenditure than is dictated by the division of responsibilities. This is because the state refunds the other sub-sectors for a number of costs, particularly statutory costs in the social area.

Figure 23

Distribution of tasks and burden between sub-sectors. 2014

Public expenditure in EU-28

EU was enlarged by Croatia on 1 July 2013. Last time EU was enlarged was on 1 January 2007 by the two countries: Bulgaria and Romania. EU was founded with European Coal and Steel Community in 1952 by the countries: France, West Germany, Italy, Belgium, Luxembourg and the Netherlands. EU has since then been expanded in 1973, where Denmark joined, 1981, 1986, 1995, 2004, 2007 and in 2013. The biggest enlargement was in 2004 where EU was expanded with ten European Countries.

Size of the public sector

There are in the EU great variations in the size of the public sector measured in terms of total public expenditure as a per cent of GDP, from 34.8 per cent (Lithuania) to 58.3 per cent (Finland). In Denmark the public expenditures amounts to 56.0 per cent of GDP.

Figure 24

Public expenditure as a percentage of GDP in EU. 2014

Source: Eurostat, table tec00023

Comparison of taxes

There are in the EU great variations tax burden (taxes and duties as a per cent of GDP), from 27.5 per cent (Lithuania) to 49.1 per cent (Denmark). Comparisons between countries should be made with caution, as the tax burden depends, for example, on whether income transfers (old-age pension, etc.) take place as net transfers, gross transfers or allowances. Net transfers are transfers that are tax free for the recipient, while gross transfers are subject to tax. In Denmark, gross transfers are most prevalent, which means that tax revenues are greater.

Figure 25

Taxes and duties as a percentage of GDP in EU. 2012

Source: Eurostat, table gov_a_tax_ag

Public EMU deficit and EMU debt in the EU

In the European Economic and Monetary Union (EMU) there is attached great importance to sound public finances. The EMU criteria are used as a guideline for the fiscal-policy situation in the EU and cover the public EMU deficit and EMU debt. The EMU criteria prescribe that the deficit of the EU Member States must not exceed 3 per cent of GDP and EMU debt must not exceed 60 per cent of GDP.

Figure 26

EMU deficit and EMU debt as a percentage of GDP in EU. 2014

Source: Eurostat, table tec00127 and tsdde410

The total deficit for EU was 3.0 per cent of GDP in 2014. The public EMU deficit was 0.7 per cent of GDP in Denmark. There are thirteen countries whose deficit is above the threshold of 3 per cent. Two of these countries are Cyprus and Portugal with EMU deficit of 8.9 per cent and 7.2 per cent, respectively.

The total EMU debt of EU was 87 per cent of GDP in 2014. In other words, the average of EU is above the limit of 60 per cent. The EMU debt of Italy, Portugal and Greece was high with 132.3, 130.2 and 178.6 per cent of GDP, respectively, while the EMU debt of Estonia and Luxembourg was low with 10.4 per cent and 23.0 per cent of GDP, respectively. In 2014, Denmark's EMU debt was 45.1 per cent of GDP.
